

[Detailed Description of the Invention]

[0001]

[Field of the Invention]

The present invention relates to novel benzothiazepine  
5 compounds having a thioamide bond and a quaternary ammonium  
substituent and to pharmaceutical compositions that contain them.

[0002]

[Prior Art]

Hyperlipidemia means a state where neutral fat, cholesterol and  
10 the like in blood are at higher levels than the normal levels and has been  
known to deserve a treatment since it is a main risk factor in ischemic  
diseases. Further, hyperlipidemia is also known to cause  
arteriosclerosis and in particular, to decrease blood cholesterol level is  
effective for the prevention and treatment of arteriosclerosis.  
15 Arteriosclerosis is also known as a cause of myocardial infarction,  
cerebral thrombosis, peripheral arterial obstruction, and arteriosclerosis  
obliterans. Syndrome X was advocated by Reaven et al. ("Diabetes", 37,  
1595-1607, 1988) and means a multiple risk factor syndrome that  
develops arteriosclerosis by accumulation of risk factors such as  
20 hyperinsulinemia, hyperlipidemia, hypertension, and abnormality of  
glucose tolerance on an individual, although the factors are not so  
serious as to indicate the conditions of diseases when they exist  
independently of each other. A cholesterol-lowering agent is considered  
to be effective for the prevention or treatment of these diseases (Japan  
25 Clinical Hyperlipidemia - Volume 1 - ISSN0047-1852).

[0003]

At present, commercially available drugs for the treatment of hyperlipidemia include HMG-CoA reductase inhibitor drugs, anion exchange resin drugs and so forth. These drugs are used for the prevention and treatment of hyperlipidemia, in particular, hypercholesterolemia and arteriosclerosis. Furthermore, these drugs are also used in the prevention or treatment of myocardial infarction, cerebral thrombosis, peripheral arterial obstruction, and arteriosclerosis obliterans, which are diseases caused by hypercholesterolemia or arteriosclerosis.

[0004]

HMG-CoA reductase inhibitors inhibit the activity of HMG-CoA reductase, resulting in a decrease in the amount of cholesterol in the liver, so that the low density lipoprotein (LDL) receptors in the liver increase and incorporate cholesterol in blood into the liver to decrease the cholesterol level (see Science, 232, 34, 1986). At present, the HMG-CoA reductase inhibitors have become standard drugs in medical therapy for the treatment of hyperlipidemia.

[0005]

Further, cholestyramine, an example of an anion exchange resin, prevents the reabsorption of bile acid in intestines by adsorbing bile acid in the bowel. This results in increased synthesis of bile acid from cholesterol in the liver. As a result, LDL receptors increase in the liver and incorporate LDL cholesterol in blood into the liver, thereby lowering the cholesterol value (Reichner, E., et al., Journal of Lipid Research, 31,

2219-2226, 1990).

[0006]

Primary biliary cirrhosis (PBC) is a disease, a major pathological condition of which is cholestasis in the liver due to chronic

5 nonsuppurative, destructive cholangitis in the bile duct or due to loss of the bile duct. Symptoms based on this include fatigue, skin itching, icterus and the like (see Naika Sogo Shi (Medical Practice), 19, 987-992, 2001). Primary sclerosing cholangitis (PSC) is a disease attributable to inflammatory constriction of the bile duct and symptoms that accompany

10 chronic cholestasis (fatigue, skin itching and so on) occur (KAN TAN SUI, 42, 559-568, 2001). No effective therapeutic methods have been established for both the diseases; however, ursodeoxycholic acid is usually believed to be most effective and thus used in clinical (Poupon R., et al., N. Engl. J. Med., 330, 1342-1347, 1994 and Mitschell, SA. et al.,

15 Gastroenterology, 121, 900-907, 2001). In addition, both the diseases are hepatopathy accompanying cholestasis and anion exchange resins such as cholestyramine and so forth are used for improving skin itching (Heathcote J. J. Gastroenterol Hepatol., 11, 605-609, 1996). Anion exchange resins are considered to exhibit their effect by adsorbing

20 lipid-soluble substances including cholesterol and bile acid to inhibit the incorporation of these substances into the body (Thompson WG, Can. Med. Assoc. J., 104, 305-309, 1971). However, cholestyramine is used in a large dosage at a time because of being a resin, so that there occurs adsorption of vitamins, minerals, drugs and so forth. Further, they

25 readily cause gastrointestinal complications such as obstinate

constipation, so that in some cases it becomes difficult to continue taking the drug. In addition, its effectiveness is not satisfactory and it remains to be used only in a limited manner in clinical.

[007]

5 In recent years, ileal bile acid transporter inhibition has been suggested as a method different from that cholestyramine that inhibits circulation of bile acid from the bowel to the liver (The Journal of Biological Chemistry, 268, 18035-18046, 1993). In addition, International Patent Applications WO93/16055 and WO02/08211 and the  
10 like disclose compounds having ileal bile acid transporter inhibiting activity. From this it has been expected that if the ileal bile acid transporter is inhibited, the same pharmacological effects as those of cholestyramine can be obtained. Based on this background, it has been attempted to find an ileal bile acid transporter inhibitor that serves as a  
15 drug for the treatment and prevention of hyperlipidemia. However, the effectiveness of the compounds described in International Patent Applications WO93/16055 and WO02/08211 on hepatopathy accompanying cholestasis such as primary biliary cirrhosis and primary sclerosing cholangitis have not been shown yet.

20 [0008]

[Means to Solve the Problems]

It has heretofore been demanded to provide novel drugs useful as therapeutic and prophylactic agents for hyperlipidemia, and furthermore drugs that are also useful as therapeutic and prophylactic agents for  
25 cholestasis-accompanying hepatopathy, in particular primary biliary

cirrhosis and primary sclerosing cholangitis, as well as drugs that are useful as therapeutic and prophylactic agents for obesity, and fatty liver.

[0009]

[Means for Solving the Problem]

5           To solve the above-mentioned problem, the inventors of the present invention synthesized various compounds and studied their activity. As a result, they have verified that novel benzothiazepine compounds represented by formula (1) below having a thioamide bond and a quaternary ammonium substituent have high therapeutic and  
10 preventive effects for hyperlipidemia and further extremely potent ileal bile acid transporter inhibiting activity and blood cholesterol lowering activity, so that they can be used as cholesterol lowering agents, in particular as a therapeutic agent and preventive agent for hyperlipidemia, arteriosclerosis, syndrome X, etc. Furthermore, the inventors have  
15 verified that the novel benzothiazepine compounds have therapeutic and preventive effects for cholestasis-accompanying hepatopathy, so that the compounds can be used as therapeutic and preventive agents for cholestasis-accompanying hepatopathy, particularly for primary biliary cirrhosis and primary sclerosing cholangitis. Also, the inventors have  
20 verified that the compounds can be used as therapeutic and preventive agents for obesity and fatty liver.

[0010]

That is, the present invention provides a compound represented by formula (1) below.

- 5 W<sup>-</sup> and X<sup>-</sup> each represents a counter anion which may be negatively charged ions regardless of their valence and can electrically neutralize a positively charged ammonium ion in the compound of the present invention, and it is preferable that they are pharmaceutically acceptable anions. Examples of preferable anion include F<sup>-</sup>, Cl<sup>-</sup>, Br<sup>-</sup>, I<sup>-</sup>,  
 10 OH<sup>-</sup>, CH<sub>3</sub>SO<sub>3</sub><sup>-</sup>, CF<sub>3</sub>SO<sub>3</sub><sup>-</sup>, HCO<sub>2</sub><sup>-</sup>, CH<sub>3</sub>CO<sub>2</sub><sup>-</sup>, CF<sub>3</sub>CO<sub>2</sub><sup>-</sup>, ClO<sub>4</sub><sup>-</sup>, IO<sub>4</sub><sup>-</sup>, HCO<sub>3</sub><sup>-</sup>,

$\text{CO}_3^{2-}$ ,  $\text{NO}_3^-$ ,  $\text{HSO}_4^-$ ,  $\text{SO}_4^{2-}$ ,  $\text{H}_2\text{PO}_4^-$ ,  $\text{HPO}_4^{2-}$ , and  $\text{PO}_4^{3-}$ , among which  $\text{Cl}^-$  and  $\text{Br}^-$  are particularly preferable.  $\text{W}^-$  and  $\text{X}^-$  may be mutually different but more preferably they are the same.

5           In the compounds of the present invention, asymmetric centers can exist also in Z and ( $\text{N}^+\text{R}^5\text{R}^6\text{R}^7$ ) in addition to the 3-position and the 5-position in the formula (1), so that there can be a plurality of stereo isomers depending on the number of asymmetric centers. Not only pure stereoisomers but also mixtures of any plural number of isomers are  
10 included in the scope of the present invention. Further, there can exist a plurality of geometrical isomers depending on the types of Z and ( $\text{N}^+\text{R}^5\text{R}^6\text{R}^7$ ) in the compounds of the present invention. Not only pure geometrical isomers but also mixtures of any plural number of the isomers are included in the scope of the present invention.

          Further, the present invention provides pharmaceutical compositions containing the compounds of the present invention as active ingredients; a pharmaceutical composition that is a cholesterol lowering agent, a pharmaceutical composition that is a therapeutic or preventive  
20 agent for any one of hyperlipidemia, arteriosclerosis, and syndrome X, a pharmaceutical composition that is a treating or preventing agent for cholestasis-accompanying hepatopathy, a pharmaceutical composition that is a treating or preventing agent for any one of primary biliary cirrhosis and primary sclerosing cholangitis, or a pharmaceutical  
25 composition that is a treating or preventing agent for obesity and fatty

liver.

[0200]

15 (Production Method)

To obtain those compounds in which Y is an -NHCS- among the compounds represented by formula (1), a compound represented by the formula (3) below

[0201]

20 [Chemical formula 23]

[wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, m, n, and Z are as mentioned earlier, Y represents an -NHCS-, and X represents a group that can become an anion] is allowed to react with a compound represented by formula (2) below

5 [0202]

[Chemical formula 24]

[wherein R<sup>5</sup>, R<sup>6</sup>, and R<sup>7</sup> are as mentioned earlier, and the quaternary ammonium structure mentioned earlier has been changed to a tertiary amine structure].

10

[0203]

The reaction is carried out, for example, at room temperature or 40 to 100°C optionally in a solvent such as acetonitrile or N,N-dimethylformamide (hereinafter, "DMF" for short) by allowing at least an equimolar amount, preferably 1 to 5 time molar amount of the compound represented by the formula (2) to react with the compound represented by the formula (3) for 1 to 48 hours.

15

[0204]

X in the formula (3) is a group that undergoes nucleophilic substitution by the compound represented by the formula (2) and is released as an anion, preferably a group that is released as a pharmaceutically acceptable anion. Preferable examples thereof include F, Cl, Br, I, mesylate, and tosylate, and more preferably Cl, Br, and I.

The compounds of the present invention have ileal bile acid transporter inhibiting activities and have blood cholesterol lowering effects, and ameliorating effects for cholestasis-accompanying hepatopathy. Therefore, it has been verified that the compounds of the present invention can be used as cholesterol lowering agents and as ameliorating agents for cholestasis-accompanying hepatopathy. No case of death has been observed when the compounds of the present invention were orally administered to rats in a dosage of 3 mg per kg of

body weight twice a day for 3.5 days. Furthermore, the compounds of the present invention showed no microbe mutagenicity, which indicates that the compounds of the present invention can be used safely.

[0351]

5           Specific examples of the cholesterol lowering agent include pharmaceutical compositions for the treatment and prevention of any one of hyperlipidemia, arteriosclerosis, and syndrome X. Detailed explanation of these disorders is as follows.

[0352]

10           That is, examples of hyperlipidemia include hyperchylomicronemia, low density lipoprotein (LDL) hyperlipoproteinemia, familial hypercholesterolemia, very low density lipoprotein (VLDL) hyperlipoproteinemia, hypertriglyceridemia, and disorders resulting from combinations of these. means a state where eventually bile is not excreted from liver to duodenum for some reason. Once cholestasis occurs, it causes liver disorder, which is called as cholestasis-accompanying hepatopathy. Specific examples of hepatopathy caused by cholestasis include primary biliary cirrhosis, primary sclerosing cholangitis, and cholestatic hepatitis (cholangiolitic hepatitis) (Medical Encyclopedia published by Nanzando, 1333-1334). Direct causes of cholestasis may include gallstones, etc. developed in bile duct or gall bladder. Primary biliary cirrhosis and primary sclerosing cholangitis are disorders that are not caused directly by gallstones.

[0354]

The compounds of the present invention and pharmaceutical compositions containing the same are also useful as drugs for the treatment and prevention of obesity and fatty liver. Obesity means a state where fat is excessively accumulated in the body and specifically means a Body Mass Index (BMI) of more than 26 (Yoshio Ikeda et al., Nippon Rinsho (Japan Clinical), 53:229-236, 1995). Fatty liver means a state where usually, neutral fat is accumulated in large quantities in liver; in general, liver in which fat droplets are accumulated in approximately 30% or more of hepatic lobules is defined as fatty liver (Kyoichiro Tojima et al., Nippon Rinsho (Japan Clinical), 53: 354-358, 1995).

The compounds of the present invention can be administered orally to humans in the form of a tablet, a powder, a granule, a capsule, a sugar coated tablet, a liquid, a syrup and so forth. Dosages may vary according to the age, weight, and symptom of a patient. Normally, in the case of an adult, a dosage of 0.1 mg to 500 mg is administered once a day or in a plural of times a day in portions. Administration period is as follows. Generally, the drug is administered everyday for a few weeks to a few months. However, the dosage and the administration period of the drug may be increased or decreased according to the symptom of the patient.

[Examples from 3786 to 4064]

As shown in the following formulae,

[0454]

[Chemical formula 77]

[0455]

the procedure in the steps n to p in Example 1 is followed except that the compound obtained in the step m in Example 1, any one of the various acyl halides (ac-1) to (ac-17) represented by the formula (5-1), and any one of the various tertiary amines (ta-1) to (ta-377) represented by the formula (2) are used to obtain compounds of Examples 3786 to 4064 as represented by the formula (1B) as shown in Table 3. In the formula (1B), "-sp-" indicates any one of the (sp-1) to (sp-22) described above and "-an" indicates any one of the (an-1) to (an-377) described above.

[0460]

[Test Example 1]

Blood cholesterol lowering effect in rats fed on a high cholesterol diet

5 In the test example, blood cholesterol lowering effect in rats fed on a high cholesterol diet was tested according to the method described in J. Lipid, Res., 1995, 36, 10981105.

[0461]

That is, a diet containing 0.4% cholesterol and 0.5% of bile acid  
10 was given to 7 to 9 weeks old SD (IGS) male rats for 5 days before the test to increase the blood cholesterol level. Rats that showed an evident increase in blood cholesterol level as compared with that before feeding were selected and used in the test. Cholestimide (trade name: CHOLEBINE GRANULE 70% manufactured by MITSUBISHI TOKYO  
15 PHARMACEUTICALS, INC.), which is an anion exchange resin, was suspended in distilled water while the test compound was either dissolved or suspended in distilled water. These were forcibly orally administered twice a day every day from the day of beginning of the test (each n = 8). After 3 hours from the administration of drug on the last day of the test, a  
20 blood sample was taken from a jugular vein pool and serum cholesterol level was measured to study the effect of the test compound. Further, as a control group, a group (n = 8) fed on only high cholesterol diet and given distilled water was prepared and the same test procedure was followed. A commercially available kit was used for measurement of  
25 total cholesterol and HDL cholesterol. The value obtained by subtracting

an HDL cholesterol value from the total cholesterol value was taken as an LDL + VLDL cholesterol value. Assuming the LDL + VLDL cholesterol value of the control group, for which the test compound was not used, as 100%, the rate of decrease (percentage of decrease) of LDL + VLDL cholesterol value when a fixed amount of the test compound was used, was determined.

[0462]

The results are shown in Table 5 below. It has been verified that the compounds of the present invention decrease the LDL + VLDL cholesterol level and have excellent blood cholesterol lowering effect. Therefore, the compounds of the present invention have proved to be useful as drugs for the treatment and prevention of hyperlipidemia. Further, it has been verified that the compounds of the present invention have an inhibitory effect on increase of cholesterol even when a diet containing 0.4% cholesterol and 0.5% bile acid is fed and at the same time the compound of the present invention was forcibly orally administered, so that the compounds of the present invention are useful as drug for the prevention of hyperlipidemia. Note that it has also been verified that the compounds of other examples of the present invention not shown in Table below have excellent blood cholesterol lowering effect and thus the compounds have proved to be useful in particular as drugs for the treatment and prevention of hyperlipidemia.

5 comparative example.

[0464]

[Test Example 2]

Bile acid decreasing effect in portal vein of rats loaded with cholic acid

10 In this test example, the test for confirming the bile acid decreasing effect in portal vein of cholic acid-loaded rats was carried out according to the method described in Pharmacology and Therapeutics [Jpn Pharmacol. Ther., Vol. 24 Supplement, 1996, 103 (S-577) - 110 (S-584)].

15 [0465]

That is, 7 to 9 weeks old SD (IGS) rats were starved on the day before the test and thereafter. Cholic acid (200 mg/kg) and the test compound as drug to be administered, were either dissolved or suspended in distilled water containing a surfactant (trade name: Tween  
20, BIO-RAD or HCO-60, manufactured by NIPPON CHEMICALS  
COMPANY, LTD.) to a final concentration of 0.5% or 1% and the solution

was forcibly orally administered to the rats. After 2 hours from the administration, a sample of blood was taken from a portal vein and total blood serum bile acid level was measured to study the effect of the test compound (n = 6). Further, as a control group, a group (n = 6) loaded with cholic acid (200 mg/kg) only was prepared and the same test procedure was followed. A commercially available kit was used for the measurement of bile acid (trade name: SOTANJUSAN - TEST WAKO - (SOTANJUSAN = total bile acid), manufactured by WAKO PURE CHEMICAL INDUSTRIES, LTD.). Assuming the value of the control group, which is a group in which no test compound was used, as 100%, the rate of decrease (percentage (%) of decrease) of the bile acid level when a fixed amount of the test compound was used was determined.

[0466]

The results are shown in Table below. It has been verified that the compounds of the present invention decrease the bile acid level and proved to have excellent bile acid resorption inhibiting effect. Therefore, it has been verified that the compounds of the present invention are useful as drugs for the treatment and prevention of hyperlipidemia and further useful as drugs for the treatment of cholestasis-accompanying hepatopathy. Further, it has also been verified that the compounds of other examples of the present invention not described in Table 6 below have excellent bile acid resorption inhibiting effects and thus the compounds of the present invention have proved to be useful as drugs for the treatment and prevention of hyperlipidemia and as drugs for the therapy of cholestasis-accompanying hepatopathy.

\*\*) A compound 5 that shows the strongest activity among compounds described specifically in WO02/08211 (synthesis example 19); 1-{4-[4-(3,3-dibutyl-7-dimethylamino-1,1-dioxo-2,3,4,5-tetrahydro-1,4-benzothiazepin-5-yl)phenoxy)methyl]benzyl}-4-aza-1-azoniabicyclo[2.2.2]octane  
10 bromide (compound A mentioned later was used).

[Test Example 3]

In vitro assay of compounds inhibiting ileal bile acid transporter (IBAT) using Caco-2 cells

15 In this test example, the in vitro assay of compounds inhibiting ileal bile acid transporter using Caco-2 cell was carried out according to the Test Example 1 described in WO00/35889.

[0469]

That is,  $1 \times 10^{-5}$  cells/well Caco-2 cells were inoculated on a

24-well cell plate. For the assay, cells cultured for 14 days or more were used and the following procedure was followed. The cells were washed once with an assay buffer, Hank's buffer solution containing 25 mM glucose and with 10 mM HEPES (pH 7.4), and then the buffer was

5 replaced by an assay buffer to which the test compound was added. After adding [<sup>3</sup>H] taurocholate (trade name: NET-322, manufactured by DAIICHI CHEMICAL CO., LTD.) to a final concentration of 8 μM, the cells were incubated at 37°C for 30 minutes to allow [<sup>3</sup>H] taurocholate to be incorporated in Caco-2 cells by IBAT. The reaction was stopped by

10 washing twice with a buffer prepared by adding 1mM taurocholate (trade name: T-4009, manufactured by SIGMA) to the assay buffer and lysing the cells with 0.2 M NaOH. Measurement of the radioactivity was carried out by introducing the cell lysate in 4 ml of liquid scintillation cocktail (trade name: Clearzol 1, manufactured by NACALAITESC),

15 stirring the mixture well, and then measuring the radioactivity on a liquid scintillation counter (manufactured by PACKARD CO., LTD.). The inhibition rate (%) was determined from the radioactivity of a control that did not use the test compound and the radioactivity when the test compound having a fixed concentration was used and the concentration

20 of the test compound at which 50% of the IBAT activity was inhibited was determined. This method has verified that the compounds of the present invention have potent inhibiting activity against IBAT, so that the compounds of the present invention have proven to be useful as drugs for the treatment and prevention of hyperlipidemia.

[0470]

[Test Example 4]

In vitro assay of compounds that inhibit temporarily expressed human IBAT transporter or rat IBAT transporter using Cos 7 cells

5 In this test example, the in vitro assay of the compounds that inhibit temporarily expressed human IBAT transporter or rat IBAT transporter using Cos cells was carried out according to the method described in Am. J. Physiol., 274, G157-169.

[0471]

10 That is,  $2.5 \times 10^{-5}$  cells/well Cos 7 were inoculated on a 24-well cell plate. One day later, 0.3  $\mu$ g per well of cDNA of a human IBAT or a rat IBAT was transfected by using FuGENE6 (manufactured by ROCHE PHARMACEUTICAL CO., LTD.). For the assay, the cells cultured for one day after the transfection were used and the following procedure was  
15 followed. The cells were washed once with an assay buffer, Hank's buffer solution containing 25 mM glucose and with 10 mM HEPES (pH 7.4), and then the assay buffer was replaced by an assay buffer to which the test compound was added. After adding [ $^3$ H] taurocholate to a final concentration of 8  $\mu$ M, the cells were incubated at 37°C for 60 minutes.  
20 [ $^3$ H] taurocholate was allowed to be incorporated in Cos 7 cells through human IBAT or rat IBAT. The reaction was stopped by washing twice with a buffer prepared by adding 1mM taurocholate to the assay buffer and lyzing the cells with 0.2M NaOH. Measurement of radioactivity was carried out by introducing the cell lyzate in 4 ml of liquid scintillation  
25 cocktail, stirring the mixture well, and then measuring the radioactivity by

a scintillation counter. The inhibition rate (%) was determined from the radioactivity of a control that did not use the test compound and the radioactivity when the test compound having a fixed concentration was used. The concentration of the test compound at which 50% of human  
5 IBAT activity or rat IBAT activity was inhibited was determined.

[0472]

The results are shown in Table below. It has been verified that the compounds of the present invention have potent inhibitory activity against human IBAT and rat IBAT. Therefore, the compounds of the  
10 present invention have proven to be useful as drugs for the treatment and prevention of hyperlipidemia. Further, it has also been verified that the compounds of other examples of the present invention not shown in the Table have potent inhibition activity against human IBAT and rat IBAT.

- In vitro assay of compounds inhibiting temporarily expressed  
10 human IBAT transporter in which alanine 171 was substituted by serine  
using Cos 7 cells

- The in vitro assay of the compounds inhibiting temporarily  
expressed human IBAT transporter in which alanine 171 was substituted  
with serine was carried out in the same manner as in Test Example 4  
15 except for using the cDNA of IBAT in which alanine 171 was substituted  
by serine in the human IBAT amino acid sequence.

Note that actually in the case of humans, the proportion of  
individuals having the IBAT transporter in which alanine 171 has been

substituted by serine is said to be 28% [J. Clin. Invest., 1997, 99, 1880-1887].

[0475]

The results are shown in Table below. The value is a rate of inhibition (%) of the radioactivity of the test compound at a test compound concentration of 10 nM with respect to the radioactivity of the control without the test compound. It has been verified that the compound of the present invention has a potent inhibiting activity on the human IBAT in which alanine 171 is substituted by serine that is equivalent to that of the human IBAT in which alanine 171 is not substituted by serine. Therefore, the compound has proven to be useful as a drug for the treatment and prevention of hyperlipidemia. Further, it has been verified that the compounds of other examples of the present invention not shown in the Table have inhibiting activity against the human IBAT in which alanine 171 is substituted by serine.

using Cos 7 cells

In this test example, the in vitro assays of the compound on various transporters using Cos 7 cells were carried out according to the method described in Published Translation of Japanese Patent

That is,  $2.5 \times 10^{-5}$  cells/well of Cos 7 cells were inoculated on a 24-well cell plate. Two days later, the cells were washed once with an assay buffer, Hank's buffer solution containing 25 mM glucose and with  
10 10 mM HEPES (pH 7.4), and then the buffer was replaced by an assay buffer to which the test compound was added. After adding to this, [ $^3\text{H}$ ] alanine (trade name; NET-348, manufactured by DAIICHI CHEMICAL CO., LTD.), [ $^3\text{H}$ ] leucine (trade name: NET-460, manufactured by DAIICHI CHEMICAL CO., LTD.), [ $^3\text{H}$ ] phenylalanine (trade name: MT903,  
15 MORAVEK), [ $^3\text{H}$ ] methionine (trade name: MT862, MORAVEK), [ $^3\text{H}$ ] lysine (trade name: MT909, MORAKEK), or [ $^3\text{H}$ ] choline (trade name: TRK593, AMERSHAM BIOSCIENCES CO., LTD.) to a final concentration of 8  $\mu\text{M}$ , the mixture was incubated at 37°C for 60 minutes to allow Cos 7 cells to incorporate them. The reaction was stopped by washing the  
20 cells twice with assay buffer and then lyzing them with 0.2 M NaOH. Measurement of the radioactivity was carried out by introducing the lyzate in 4 ml of liquid scintillation cocktail, stirring the mixture well, and then measuring on a liquid scintillation counter. The inhibition rate (%) was determined from the radioactivity of a control without test compounds and  
25 the radioactivity when the test compound having a fixed concentration

was used, and then the concentration of the test compound at which 50% of the transporter activity was inhibited was determined.

[0479]

In the small intestine epithelial cells having IBAT therein, there are  
5 also Na<sup>+</sup> dependent transporters, which further include an amino acid  
transporter and a water-soluble vitamin transporter. Essential amino  
acids are indispensable for normal growth and healthy life support  
[TOKYO KAGAKU DOZIN CO., LTD., 2nd edition of SEIKAGAKU JITEN  
(Dictionary of Biochemistry), P1052]. Choline is a water-soluble vitamin,

[TOKYO KAGAKU DOZIN CO., LTD., 2nd edition, SEIKAGAKU JITEN

[0480]

The results are shown in Table 14. It has been verified that the  
15 compound of the present invention has significant inhibitory peculiarity  
against human IBAT and rat IBAT and has proven to be able to be a drug  
for the treatment and prevention of hyperlipidemia. Similar effects were  
obtained for other amino acids, such as leucine, phenylalanine,  
methionine, and lysine, and even choline, which is a water-soluble  
20 vitamin. Further, it has also been verified that compounds of other  
examples of the present invention have significant inhibitory specificities  
against human IBAT and rat IBAT.

#### Cholestasis-accompanying hepatopathy model

The "cholestasis-accompanying hepatopathy" model in this test  
5 example was handled by referring to apoptosis induction in liver cells of  
hypercholesterolemia model described in [Am. J. Physiol., 1995, 268,  
G613-G621].

[0483]

That is, a diet containing 0.4% of cholesterol and 0.5% of bile acid  
10 was given to 7 to 9 weeks old SD (IGS) male rats for 4 days. The test  
compounds were forcibly orally administered twice a day everyday from  
the day of starting of feeding with the high cholesterol diet (n = 8). As a  
control group, a group (n =8) fed with only the high cholesterol diet was  
prepared. After 3 hours from the administration of drug on the last day  
15 of the experiment, the livers were extracted from the rats immediately  
after bloodletting from the abdominal aorta and fixed with a 10% neutral  
buffered formalin solution (trade name: FA-F96 manufactured by  
KOKUSAN CHEMICAL CO, LTD.). After the fixation, the livers were  
dewatered and embedded by use of a closed automatic embedding  
20 apparatus (trade name: ETP-180B, manufactured by SAKURA CO., LTD.)  
and thin slices of a thickness within the range of 2  $\mu$ m to 5  $\mu$ m were  
prepared with a microtome (trade name; IVS-410, manufactured by  
SAKURA CO., LTD.). Then, hematoxylin-eosin staining was performed  
on these thin sections using an automatic dyeing apparatus (trade name:  
25 DRS-60, manufactured by SAKURA CO., LTD.). Total number of mitotic

cells in each slice was obtained by measuring for each section the number of mitotic cells at 10 different places in an area of  $200\ \mu\text{m} \times 200\ \mu\text{m}$  in the same section.

[0484]

- 5           The results are shown in Table below. It has been verified that the compounds of the present invention exhibit a decreased number of mitotic cells in the liver and have effects of ameliorating cholestasis-accompanying hepatopathy. Therefore, the compounds of the present invention have proven to be useful as drugs for the treatment
- 10   and prevention of cholestasis-accompanying hepatopathy.

“Cholestasis-accompanying hepatopathy” model

The “cholestasis-accompanying hepatopathy” model in this test example was handled by referring to the method by Kanno et al. [Kanzo (Liver) 43 Suppl (1): A126, 2002].

10 [0487]

That is, the abdomen of a 7 to 10 weeks old SD (IGS) male rat was cut open under anesthesia with pentobarbital and partial ligation surgery of the bile duct was carried out. A blood sample was taken from the femoral vein before the surgery and this was taken as

15 pre-administration value. The test compound and 200 mg/kg of bile acid were forcibly orally administered twice a day for 3.5 days from the next day of the surgery (protocol A). The test compound and 200 mg/kg of bile acid were forcibly orally administered twice a day for 3.5 days without carrying out the partial ligation surgery (protocol B). In both the cases,  
20 the test compound was dissolved or suspended in distilled water or an aqueous solution of 1% HCO60 (manufactured by NIPPON CHEMICALS

COMPANY, LTD.). Physiological saline was administered to a control group, while 25 mg/kg of cholestyramine (manufactured by SIGMA) or 50 mg/kg of ursodeoxycholic acid (manufactured by MITSUBISHI PHARMA CO., LTD.) as a comparative example was administered. Further, to  
5 consider the influence of the surgery, a pseudo operation group (a Sham group) was established as necessary. After 6 hours from the administration of the drug on the last day of the test, a blood sample was taken from the abdominal aorta and AST (GOT), ALT (GPT), and ALP in the blood were measured by using the measurement kit (GOTII-HA TEST  
10 WAKO, GPTII-HA TEST WAKO, and ALKALINE PHOSPHER-HA TEST WAKO respectively, all manufactured by WAKO PURE CHEMICAL INDUSTRIES, LTD.) with an auto analyzer (NITTECH ANALYZER SUPER Z818).

[0488]

15 The results are shown in Tables below. It has been verified that the compounds of the present invention inhibit the rise in AST, ALT, and ALP caused by partial ligation of the liver and loading of bile acid and have effects of ameliorating cholestasis-accompanying hepatopathy. Therefore, the compounds of the present invention have proved to be  
20 useful as drugs for the treatment and prevention of cholestasis-accompanying hepatopathy, in particular as drugs for the treatment and prevention of primary biliary cirrhosis and primary sclerosing cholangitis. Further, it has also been verified that the compounds of other examples of the present invention not shown in  
25 Tables 8 to 10 have excellent ameliorating effect on

cholestasis-accompanying hepatopathy.

Effect on rat liver cholesterol 7- $\alpha$ -hydroxylase activity (7 $\alpha$ -Ohase)

- In this test example, the test for confirming the effect on rat liver cholesterol 7- $\alpha$ -hydroxylase activity (7 $\alpha$ -Ohase) was carried out according to the method described in [Analytical Biochemistry, 1986, 158, 228-232].

[0492]

That is, the test compound and vehicle (injectable water, trade name: manufactured by OHTSUKA PHARMACEUTICAL CO., LTD.) were administered to 6 weeks old SD (IGS) rats using an oral sonde for 14

days (n = 5). Solid diet (trade name: CRF-1, manufactured by ORIENTAL YEAST CO., LTD.) was given as a diet and a sterilized tap water was given as drink water and the rats were allowed to take them freely. The rats were dissected and the livers were extracted. The  
5 livers were preserved temporarily at -80°C. Thawed liver samples were homogenized in 1.15% KCl and then centrifuged to prepare liver microsomes. Final pelletized materials were resuspended in a buffer solution of sodium phosphate/potassium phosphate, followed by incubation of an aliquot at 37°C for 20 minutes in the presence of NADPH.  
10 The 7 $\alpha$ -hydroxy-cholesterol formed was converted into 7 $\alpha$ -hydroxy-4-cholesten-3-one by cholesterol oxidase. After extraction of this in petroleum ether, the organic solvent was evaporated and the residue was dissolved in isopropanol. An enzyme product was separated by injecting the aliquot of the extract into a reverse phase  
15 HPLC column (trade name: Finepack SIL-5, JASCO) and the substance eluted was quantated by using a 240 nm UV detector.

[0493]

It has been verified that the compounds of the present invention have potent enhancing effects on the activity of liver cholesterol  
20 7- $\alpha$ -hydroxylase (7 $\alpha$ -Oase) that is included in the mechanism of blood cholesterol lowering effects (Arterioscler Thromb Vasc. Biol., 1998, 18, 1304-1311) due to IBAT, which is an ileal bile acid transporter and that the compounds of the present invention can be used as drugs for the treatment and prevention of hyperlipidemia and so forth.

[Test Example 10]

Microbial mutagenicity (Ames test)

In this test example, the microbial mutagenicity test was carried out according to Ames Salmonella Mutation Assay.

5 [0495]

The strains used are *Salmonella typhimurium* TA98 and *Salmonella typhimurium* TA100 strains. In an L-shaped tube containing a sterilized preculture medium (trade name: Nutrient Broth No. 2, manufactured by KANTO KAGAKU) was added a loopful of *Salmonella*  
10 *typhimurium* TA98 or *Salmonella typhimurium* TA100, which then was cultured in a shaking incubator at 37°C, for 8 hours with 100 shakes per minute. 0.1 ml of this microbial culture broth was added to 2 ml of sterilized soft agar warmed at 45°C, containing 0.05 mM of L-histidine and 0.05 mM (+)-biotin. After stirring, the mixture was spread on a  
15 minimum glucose agar plate medium (trade name: TESMEDIA AN, manufactured by ORIENTAL YEAST CO., LTD.) in a Petri dish and allowed to solidify. A circular filter paper was made by punching a filter paper (trade name: Quantitative Ashless No. 7, manufactured by ADVANTECH COMPANY, LTD.), sterilized, and disposed on the solidified  
20 agar. Then, 1 µl of the test compound having a concentration of 10 mM was put on the filter paper and culturing was performed at 37°C for 48 hours. For the judgment of the microbial mutagenicity, the occurrence of a mutant colony centered on the filter paper where the test compound was diffused was judged as positive and no occurrence of mutant  
25 colonies in that area was judged as negative.

[0496]

As a result, it has been verified that all the compounds of the examples of the present invention were negative on both TA98 and TA100 in the microbial mutagenicity test (Ames test) and have no mutagenicity.

- 5 Thus, the compounds of the present invention have proven to be safe. Therefore, it has been indicated that the compounds of the present invention can be drugs for the treatment and prevention of hyperlipidemia.

10 [Effects due to the Invention]

- Since 1, 4-benzothiazepine skeleton, which is a basic skeleton of the compound in the present invention, has a basic nitrogen at the 4-position, which is a position adjacent to the asymmetric center, it is easy to acquire an optically active substance by an optical resolution agent such as camphorsulfonic acid derivative and tartaric acid derivatives. Further, due to the presence of this basic nitrogen, pharmaceutically acceptable salts of various acids are formed. Since it is possible to acquire compounds that are readily soluble in water, this skeleton is a useful basic skeleton in the manufacture of pharmaceuticals.
- 15
- 20 The compounds of the present invention, in which a thioamide bond and a quaternary ammonium substituent are introduced to this skeleton, are novel compounds and have very potent ileal bile acid transporter inhibiting activities as compared to the other known compounds having this skeleton. Further, the compounds of the present invention have
- 25 stability such that they are difficultly metabolized in vivo and have

reduced toxicity to an alimentary canal. According to the test examples mentioned above, the compounds are useful as cholesterol lowering agents and have been confirmed to be useful as pharmaceutical compositions for the treatment and prevention of hyperlipidemia, arteriosclerosis, syndrome X etc. Further, the compounds of the present invention are also useful as curing agents for cholestasis-accompanying hepatopathy and have been confirmed to be useful as pharmaceutical compositions for the treatment and prevention of cholestasis-accompanying hepatopathy, particularly for the treatment and prevention of primary biliary cirrhosis and primary sclerosing cholangitis. The compounds of the present invention have been confirmed to be useful as pharmaceutical compositions for the treatment and prevention of obesity and fatty liver.
